How did you install Docker?

- Find the ToolBox Docker Quickstart Terminal to run
- Or, find the Docker Application to run
- You will be using the terminal window that is opened for your own work

Toolbox Quickstart command, MacOS

• bash --login '/Applications/Docker/Docker Quickstart

Terminal.app/Contents/Resources/Scripts/start.sh'

Check that Docker is working

docker run -t hello-world

List Docker's containers

• docker images ls

For loops

- Is an interpreted, object-oriented, high-level programming language with dynamic semantics.
- Excellent for Rapid Application Development thanks to Its high-level built in data structures, combined with dynamic typing and dynamic binding
- A scripting language for tool-making or automation
- Used for quick and dirty solutions, quick automation, or to connect existing components together from other languages.

If statements

For loops

- Python's simple, easy to learn syntax emphasizes readability and therefore reduces the cost of program maintenance.
- Python supports modules and packages, which encourages program modularity and code reuse.
- The Python interpreter and the extensive standard library are open source and freely available in all major platforms

Users of Python Programming

- Industrial Light and Magic (George Lucas to create the FX for Star Wars).
- Google
 - Googles very first web-crawling spider was first written in Java 1.0 and was so difficult that they rewrote it into Python.
- Facebook
 - Responsible for multiple services in infrastructure management
- Netflix
 - Used to power data analyses tasks from the server side
- Dropbox
 - Built its API in Python
- And others; Instagram, Spotify, Quora, Reddit

- Download and install the version of Python3 for your OS
- Ask questions if you have trouble installing the program
- Check with the installation material to learn how to launch Python3 from your machine.

Running the Python3 Shell

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

For loops

- Type statements or expressions at prompt:
- print("Hello, world")
- x = 12**2
- print(x)
- print(x/2)
- # bla bla bla...
 - (this is a comment: everything after the # is ignored)

Data types

Note: Use identifiers to help you remember the types!

Docker

Mathematical Operators

Strings

If statements

For loops

Reading from files

• Integers, counting numbers

- num_int = 1
- Floats, decimals
 - num_float = 3.1415
- Strings
 - s_str = " Hello World"

Combining variables in print statements

```
x_int = 1
print(" The integer variable is :", x_int)

num_float = 3.14
print(" The float variable is :", num_float)

s_str =("Hello World'')
print(" The integer is equal to", s_str)
```

Mathematical Operators

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

Reading from files

Mathematical Operators

- \bullet 3 + 4 # Addition
- 3-4 # Subtraction
- \bullet 3 * 4 # Multiplication
- $3/4 \# \text{ Division } (\frac{3}{4})$
- ullet 3\%4 # Modulus; Returns the remainder from the division
- 3**4 # Powers; raise three to the power of four

$$= 3 * 3 * 3 * 3$$

$$= 3^4$$

$$= pow(3,4)$$

Calling positions in strings

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
# Remember each char of a string has own position
s_str = "ABC"
s_str[0] = 'A'
s_str[1] = 'B'
s str[2] = 'C'
s str[200] = ??
# Another way to iterate
# through a string using its length
for i_int in range(len(s_str)):
  print(s_str[i_int])
```

Strings

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
Examples of working with strings
```

```
"hello" + " world" # concatenation
"hello" * 3 #repetition
"hello"[0] # indexing
"hello"[-1] # indexing from end
"hello"[1:4] # slicing out a subsequence
len("hello") # determine how many characters, size
"hello" < "jello" # comparison of ABC order
"e" in "hello" # True, "e" is found in the string</pre>
```

```
# General rule:
```

```
single quotes and double quotes are the same
'abc' == "abc"
```

Working with strings

Docker

Conditional Statements

Watch for the white space in the code!

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
if testScore > medianScore:
   print("Above average.")
else:
   if testScore == medianScore:
     print("Average.")
   else:
     print("Below average.")
```

Conditionals: If statements

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
An if statement is a programming conditional statement that, if proved true, performs a specific function or task. If the condition is false, then another procedure is performed instead.
```

```
num_int = 5 # Assignment of 5 to variable "num_int"
if num_int == 3: # condition to check
  print(" True") # condition is true
else: # condition is not true
  print(" False") # num_int, is NOT equal to 3
```

```
#make a compressed conditional statement,
# no "else" statement necessary
num_int = 4
if num_int == 4: print("True")
```

If statements

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
name_str = "Bill"
if name_str == "Bill":
  print("Hello Bill!")
else:
  print("You are not Bill.")
# Place the name in a string to print
  print("Your name is :",name_str)
```

For statements

Docker

Python

GetPython

Python3 Shell

Mathematical Operators

Strings

If statements

For loops

```
A for loop is a statement in programming that performs predefined tasks while or until a predetermined condition is met.
```

```
# counter program
for i_int in range(10):
  print(" Count is:" ,i_int)
  # Note: you could add some conditional
  # if-statement here to check the value of i_int.
# Iterate through the string's chars
s_str = "hello world"
for i_int in s_str:
  print(i_int)
  # Note: you could add an if-statement here
```

Find a Single Variable in a File
